1) D2 — Working Prototype Summary

Live URL:

<https://erickdepaz1995-source.github.io/sushi-ordering-platform/>

What the prototype does today

The current D2 prototype presents the customer-facing menu for Nori House. Users can browse the available sushi products, view basic information such as name, description, image and availability, and interact with the menu. The prototype is published through GitHub Pages and can be accessed from any browser using the live URL.

Wired features

The prototype currently includes two functional interactions. Users can filter the menu by category, such as “Rollos clásicos” or “Nigiri”, and the displayed products update accordingly. Users can also select a product to open its detailed view, where information such as image, category, availability, name, description, price, details and ingredients is displayed.

Not implemented yet

The shopping cart, order confirmation, administrator login, restaurant dashboard, order management and subscription functionality are not implemented in D2. These remain planned features for future iterations of the project.

2) Directing the AI during the build

During the development process, I used Codex as an AI coding assistant to review and refine the prototype. One concrete example was asking the AI to compare the current FRD with the actual implementation and identify which requirements were already functional and which were still pending. The AI identified that the category filtering and product detail view were working in the prototype but were not explicitly described in the FRD. Based on this review, I directed the AI to update only the FRD so that it accurately reflected the D2 implementation, while keeping features such as the shopping cart, login, dashboard and order management as future work. I reviewed the proposed changes before committing them to the repository. I also tested the prototype manually using Live Server and later through the public GitHub Pages URL to verify that the menu, category filters and product detail navigation worked correctly.
